

FAQs

1. How are my earnings from the game computed?

The computer subtracts the threshold value from your final net accumulated outcomes at the end of the game.

For example, if the threshold is \$100 and your net accumulated outcomes at the end of the game are \$250, your earnings are $\$250 - \$100 = \$150$.

2. What happens if my final net accumulated outcomes in the game are below the threshold value?

In this case you lost money.

For example, if the threshold is \$100 and your net accumulated outcomes at the end of the game are 80\$, you lost \$20.

Note that your potential loss is capped at \$50. For example, if the threshold is \$100 and your net accumulated outcomes at the end of the game are 10\$, you lost \$50.

3. Why will the threshold value be revealed only once the game is over?

Because knowing the value may influence your behavior during the game. For us to be able to interpret the data collected from you during the game, it is important that you don't know the value.

4. What kind of data are you going to collect from me during the game?

We will be recording your choice at each round during the game, how long you took to reply, and your replies at the 'wheel of fortune' lotteries that you may be asked to play during the experiment.

5. What determines whether I'll be able to play a 'wheel of fortune' lottery during the experiment?

Both luck (random choice from the computer) and your behavior in the game (we can tell you more once the game is over if interested).
